

“Chemical Engineering Education and the role of Cyberinfrastructure”

Thomas F. Edgar
Department of Chemical Engineering
University of Texas at Austin

AIChE Meeting
New Orleans, LA
April 26, 2004

Cyberinfrastructure Elements in ChE Education

- Integrated computing in ChE core courses
- New computing applications – CFD, molecular modeling
- New curricular themes (NSF workshops)
- Web-based experiments
- Increased usage of audio/video/multimedia
- Internet 2
- Distance Education
- Grid computing

Technology Drivers

- wireless, handheld devices
- household LANs (audio, video, appliances – toasternet)
- disintermediation (e.g., shopping)
- integrated voice, data, video networks
- voice communication with computers

New Digital Generation

- Lives with pervasive microprocessors and telecommunications (e.g., cell phones)
- Napster, Playstation, Pokemon
- Demands computer interaction, plug and play
- Learns through experimentation, group interaction

Paradigm shifts in chemical engineering education.

Integrated Computing in the ChE Curriculum

- White paper by CACHE Corporation (www.cache.org)
- Teaching computer programming
- Teaching information technology
- Use of process simulators (sophomore-senior)
- Course software packages ($1 \leq n \leq 11$) - how many ?
- Prototypical approaches at six universities

Numerical vs. Analytical Approaches in Modeling Physical Behavior

- Need to learn both approaches (advantages and disadvantages)
- Need to re-examine role of detailed analytical solutions (training for industry vs. graduate school)
- Use fewer simplifying assumptions in numerical solutions
- Public can run simulators in science museums, so ChE education can find a way
- Observations can come from physical experiments and numerical experiments
- CFD software is important new element for cyberinfrastructure (Fluent, FEMLAB)

Reasons for modeling and simulation

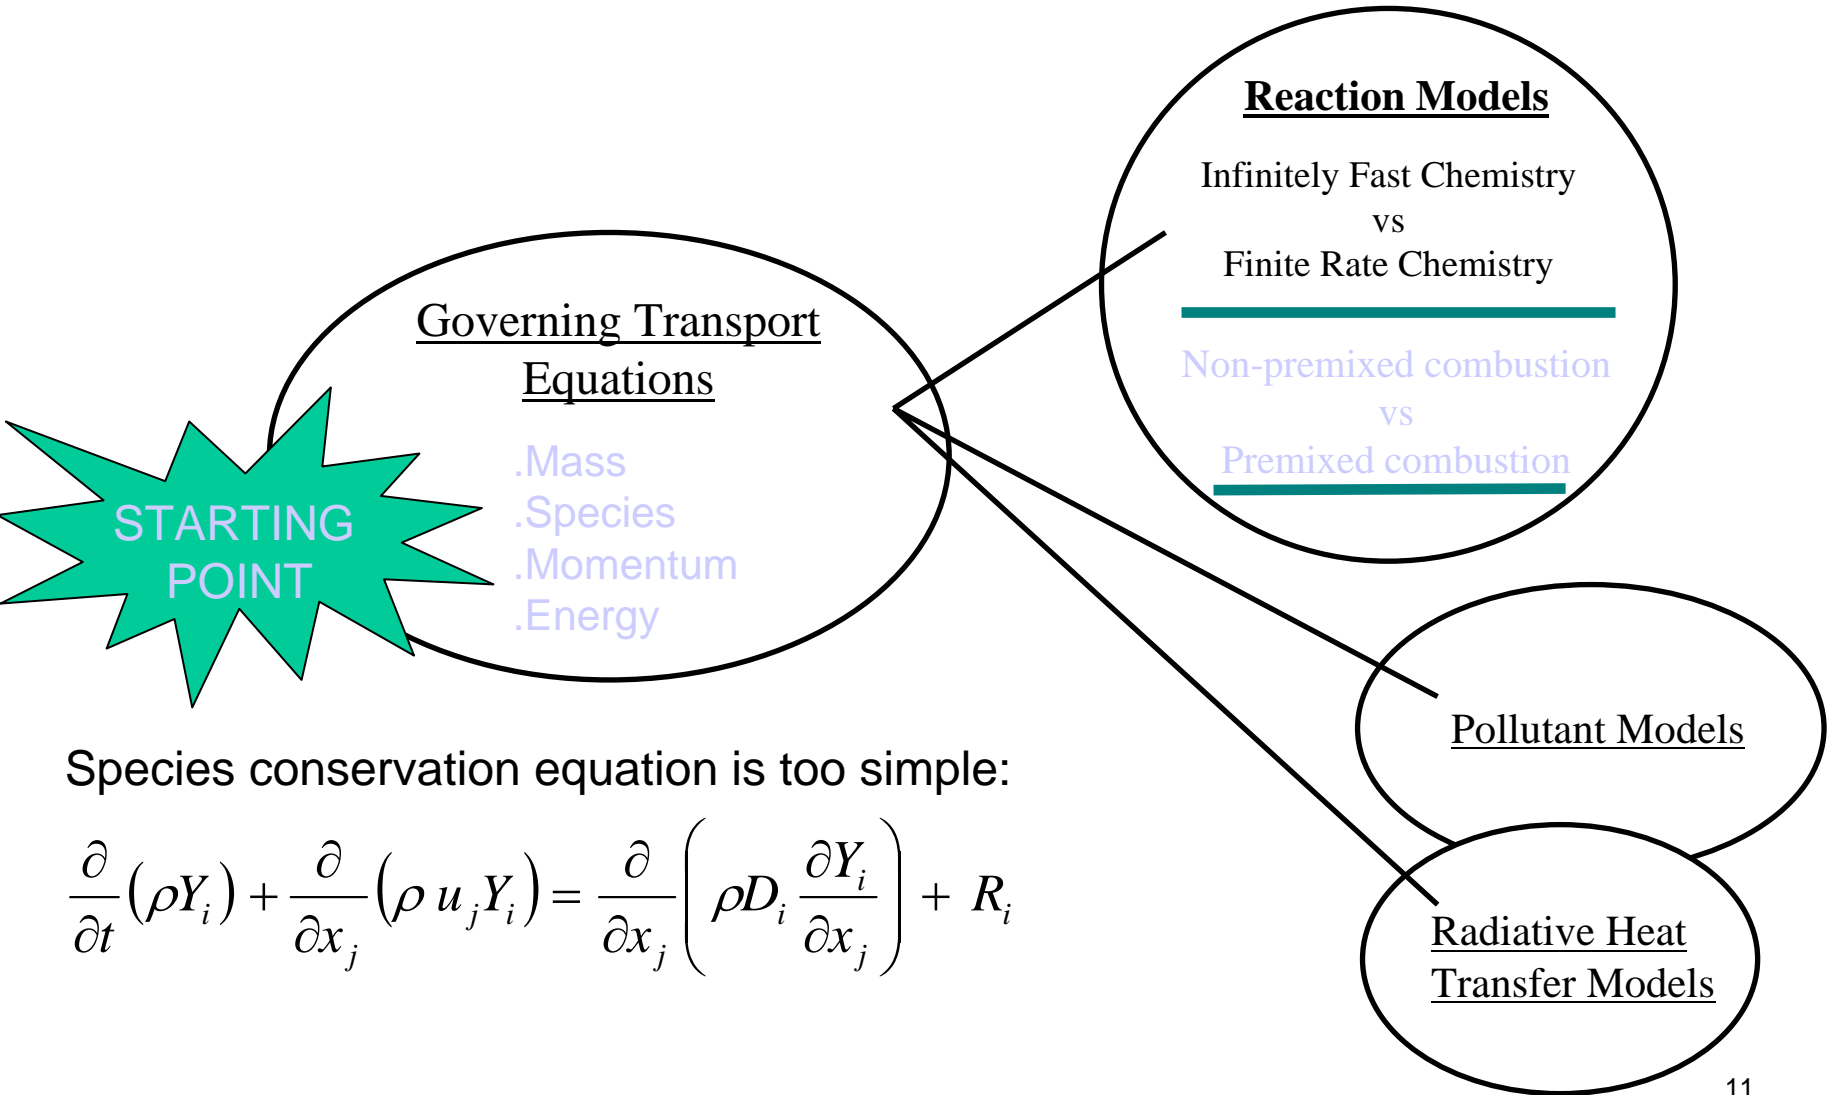

- Fundamental understanding of the process is possible under correct assumptions
- Sensitivity analysis
- Aid in scaling systems to either larger or smaller throughputs
- Aid in optimization and control strategies

Flare Modeling

- Challenging project that requires coupled physical processes be modeled
- These processes include
 - . complex chemical reactions
 - . soot formation
 - . radiation
 - . turbulent fluid flow

Approaching the Problem...

Species conservation equation is too simple:

$$\frac{\partial}{\partial t}(\rho Y_i) + \frac{\partial}{\partial x_j}(\rho u_j Y_i) = \frac{\partial}{\partial x_j} \left(\rho D_i \frac{\partial Y_i}{\partial x_j} \right) + R_i$$

CFD

- CFD is a powerful numerical tool for simulating the complicated fluid flow, heat transfer, and chemical reactions in a combustion system
- CFD has gained in popularity in recent years due the dramatic increase in computer power
- CFD is based on fundamental physics and not on empirical functions
- In dealing with combustion simulations, the complexity of the problem requires the CFD engineer to have specialized knowledge to set up complex 3-D CFD simulations and interpret the results
- FLUENT 6.1, C-SAFE and FEMLAB3.0 are options

CFD Solution Methodology

- Mesh generation
- Flow specification
- Calculation
(numerical solution)
- Analysis of Results

Fluent Capabilities...

Species Model

- Model

Summary of the NSF Workshops (2003)

(see <http://web.mit.edu/che-curriculum>)

- Changes in science and the marketplace call for extensive changes to the chemical engineering curriculum
- The enabling sciences are: biology, chemistry, physics, mathematics
- There is a core set of organizing chemical engineering principles, emphasizing molecular level design
 - Molecular Transformations, Multi-scale Analysis, Systems
- Chemical engineering contains both product and process design
- There is agreement on the general attributes of a chemical engineer

Molecular Transformations

- Molecular transformations: the molecular basis of chemical engineering
 - goals: students recognize that properties can be changed by changing structure via qualitative and quantitative computation
- Molecular Basis of Thermodynamics (Sophomore)
 - intro quantum and stat mech, equilibria, 1st Law, 2nd Law, equations of state, phase transitions
- Classification of Molecules (Sophomore)
 - qualitative concepts (“hydrophilic”, “hydrophobic”), quantitative structure-property correlations, macromolecules, biological interactions
- Molecular Basis of Reaction Rates (Sophomore or Junior)
- Molecular Basis of Other Properties and Constitutive Equations (Junior)
 - transport properties, effects of polymer/biomolecular conformations, mixture properties, some elements of molecular biology
- Special Topics (Junior/Senior electives)
 - interfacial phenomena, nucleation/growth, material props, directed evolution

Multi-Scale Analysis

- **Multi-scale analysis:** Application of chemical engineering principles over many scales of length and time
- **Interfaces and Assemblies (Sophomore)**
 - adsorption, extraction, interfaces, Brownian motion, molecular forces, nucleation, colloidal interactions, molecular assemblies
- **Homogeneous Reactor Engineering (Sophomore)**
 - PFR and CSTR
- **Multi-scale descriptions of reactive systems (Junior)**
 - Integrated approach to continuum momentum, heat and mass transfer with reactivity, stochastic processes, heterogeneous systems and interfacial phenomena
- **Beaker-to-Plant: Implementation of Multi-scale Principles for Product and Process Design (Senior)**
 - design of a product and process to make the product: polymer, drug delivery system (includes lab component for making of prototype)

Systems

- **Systems: tools for synthesis, analysis and design of processes, units and collections thereof**
- **Introduction to Systems (Sophomore)**
 - conservation laws for simple dynamic and steady state systems
 - build model for experimental dynamic system
 - collect and analyze lab data
 - build numerical simulation for simple models
 - parameter estimation (exposure to complexity and uncertainty)
 - construct equipment/sensor
- **Introduction to Molecular Systems (Junior)**
 - stochastic systems and molecular level reactions as systems
 - simulation as an enabling technology
 - use of models in predicting system behavior (analysis) and in shaping system behavior (synthesis)
 - energy and mass integration, design for the environment
 - optimization principles for design, parameter estimation and decision-making
 - examples from microelectronics, catalysis, systems biology, stochastic kinetics

- **Systems and the Marketplace (Senior)**
 - multi-scale systems: separation and resolution of time and length scales
 - design and analysis of feedback
 - monitoring, fault detection and sensitivity analysis
 - design experience: economics/business skills, safety, marketing, environmental impact, life cycle analysis, ethics, globalization, IP
 - process operations
 - planning, scheduling, and supply chains
 - Tie-in with Beaker to Plant (Process and Product Design)

Possible Case Studies

- Desalination of sea water
- Hydrogen from biomass
- Synthesis of specialty polymers
- Global climate change
- Regional air quality analysis
- Production, separation, and purification of natural products and recombinant proteins
- Reconstruction of cellular networks. Design of cells and biomolecules
- Insulin regulation
- Pharmacokinetic and pharmacodynamic models
- Biomedical control systems
- Drug patch design
- The human body as a chemical process
- Environmental cycles (water, carbon, nitrogen, etc.)
- Chemical plant design and operation
- Cell design (human, animal, plant) and regulation of metabolic pathways
- Product design

Laboratory Experience

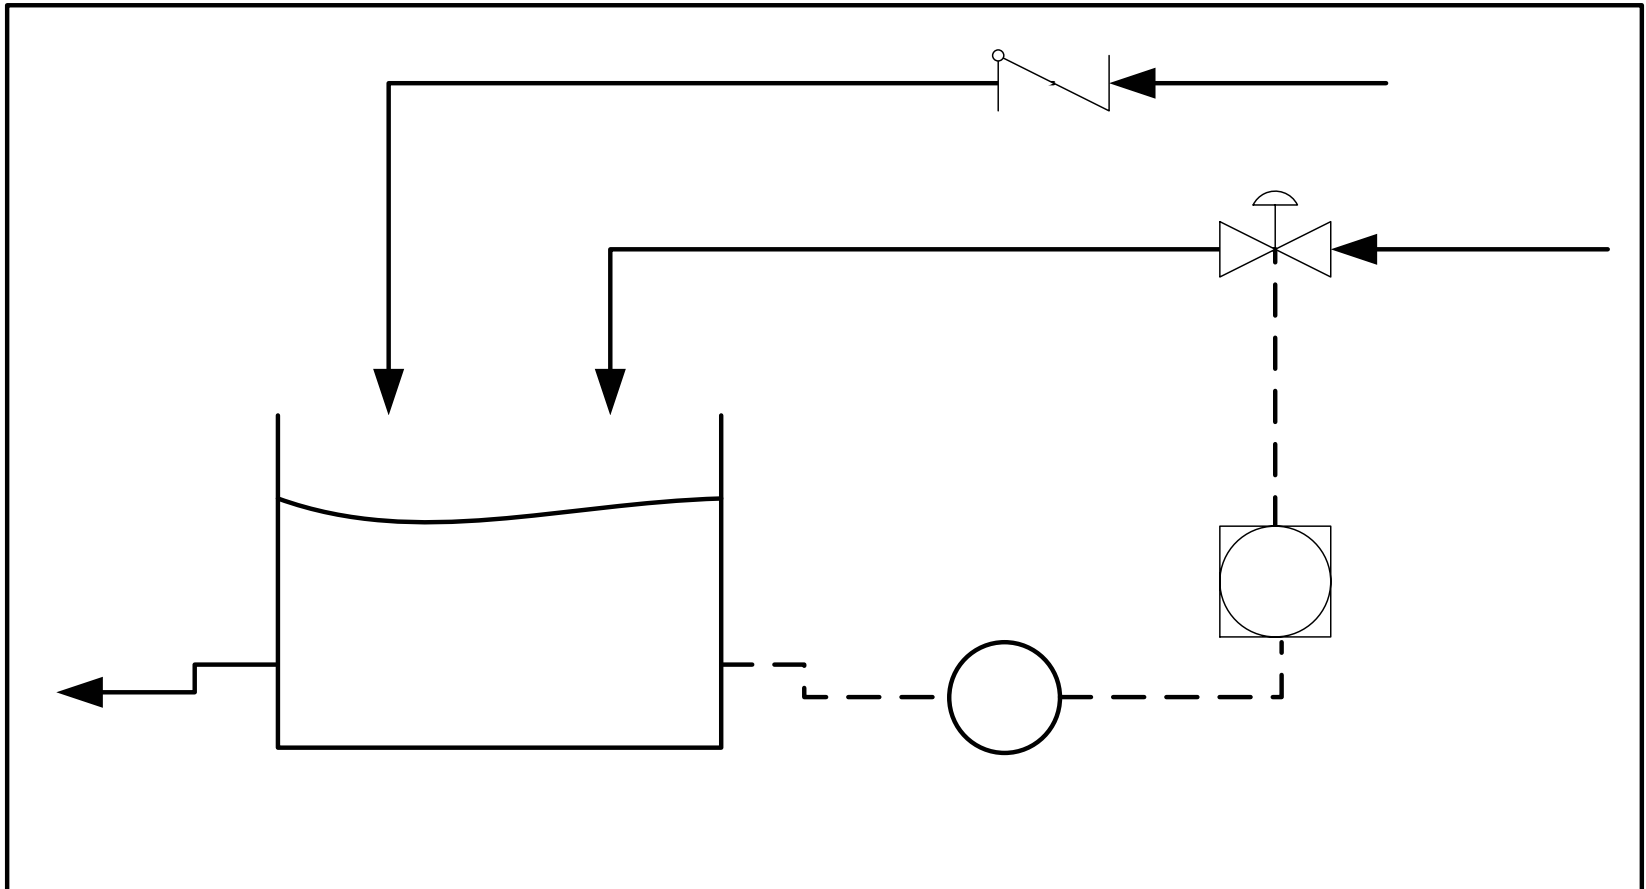

- Includes VLAB, ILAB and hands-on
- Will teach:
 - teamwork and communication skills
 - ability to handle real (i.e., messy) problems and data
 - open-ended problem-solving
 - safety
 - environmental and regulatory issues
 - reinforcement and visualization of concepts from courses
- Can also teach
 - experimental design
 - basic lab techniques and instrumentation

Cyberinfrastructure and Laboratory Experiments

- Lab equipment can be connected to Internet for remote operation
- Permits sharing of experimental systems among universities
- Offers a way to reinforce lecture concepts with live demonstrations (web-connected classrooms classrooms)
- Should not be viewed as a way to decrease the undergraduate laboratory experience
- Experiments developed by U. Tennessee (Chattanooga), MIT, U. Texas, U. Florida

Dynamics and Control Experiments (UT-Austin)

Liquid Level Control

Heated Pipe Control

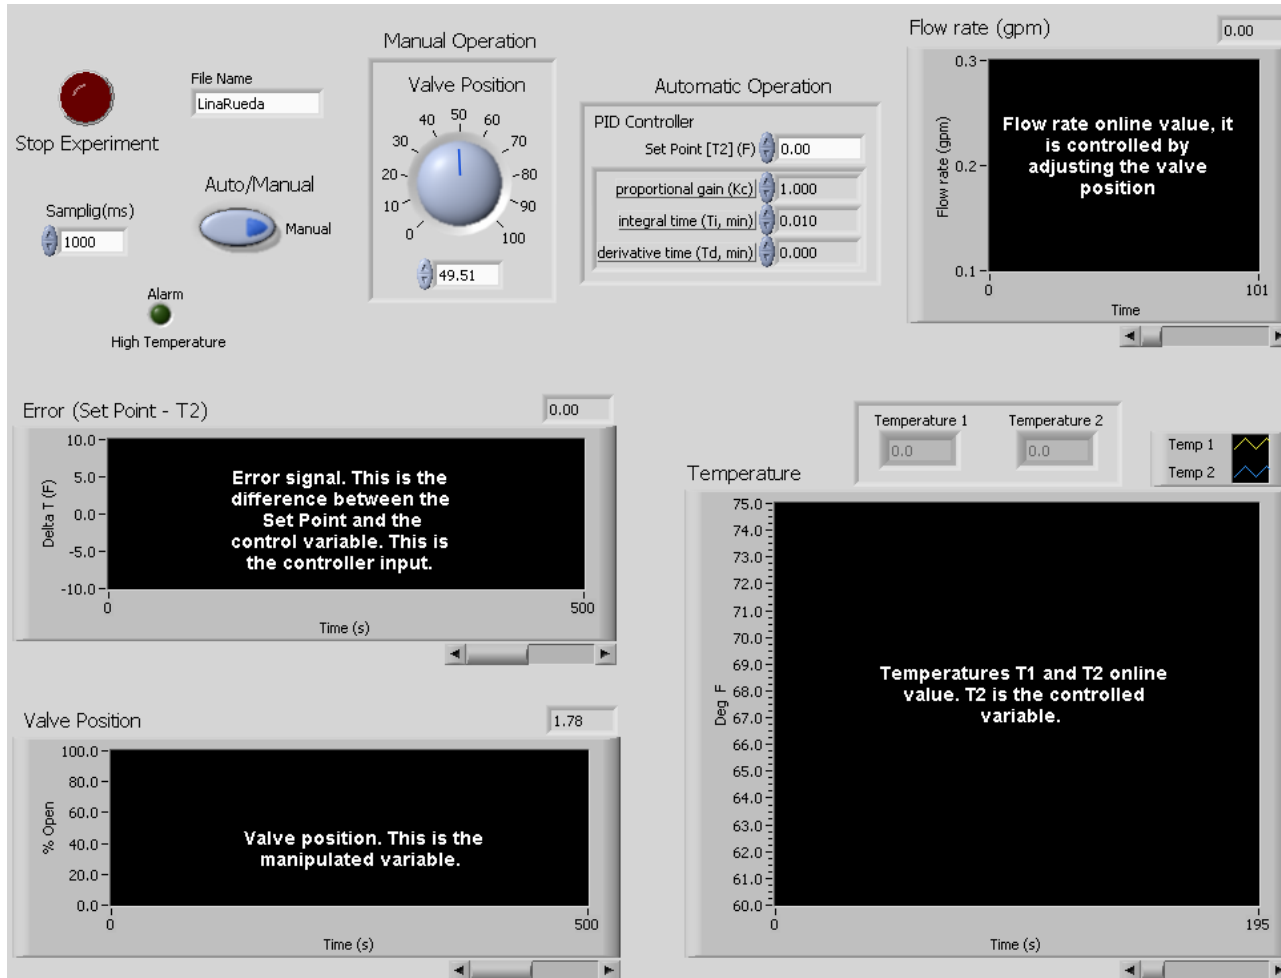

Computer Interface - 1

The screenshot shows a Microsoft Internet Explorer browser window displaying a web-based control interface for a "Heated Pipe Control" experiment. The browser's address bar shows the URL "6.118.111/heatedpipe.htm".

Key interface elements and annotations include:

- Browser Menu:** File, Edit, View, Favorites, Tools, Help.
- Address Bar:** 6.118.111/heatedpipe.htm
- Annotations:**
 - 3) Click the arrow to operate the experiment:** Points to the "Operate" button (a square with a right-pointing arrow) in the top left.
 - 1) Introduce the file's name here:** Points to the "File Name" input field containing "LinaRueda".
 - 2) Introduce the sampling time here:** Points to the "Samplig(ms)" input field containing "1000".
 - With this option you will be able to see who as control of the experiment:** Points to the "Request Control of VI" option in a context menu.
 - You can always see how much time remains for the server to regain control. Server regains control if user has controlled the experiment for 60 minutes.** Points to the "Show Control Time Remaining" option in the context menu.
 - Control granted:** A yellow box highlighting the "Control granted" message in the bottom right.
 - This message informs that you have control of the experiment:** Points to the "Control granted" message.
- Control Panel Elements:**
 - Stop Experiment:** A red circular button.
 - Auto/Manual:** A toggle switch currently set to "Manual".
 - Valve Position:** A circular gauge with a needle pointing to approximately 49.51.
 - Automatic Operation:** A section containing a "PID Controller" with three input fields: "Set Point [T2] (F)" (0.00), "proportional gain (Kc)" (1.000), "integral time (Ti, min)" (0.010), and "derivative time (Td, min)" (0.000).
 - Flow rate (gpm):** A vertical scale on the right side, ranging from 0 to 0.3.
 - Error (Set Point - T2):** A graph showing the error signal, with a y-axis labeled "Delta T (F)" ranging from -5.0 to 10.0.
 - Temperature 1:** A digital display showing "0.0".
 - Alarm:** A green indicator light labeled "High Temperature".

Computer Interface -2

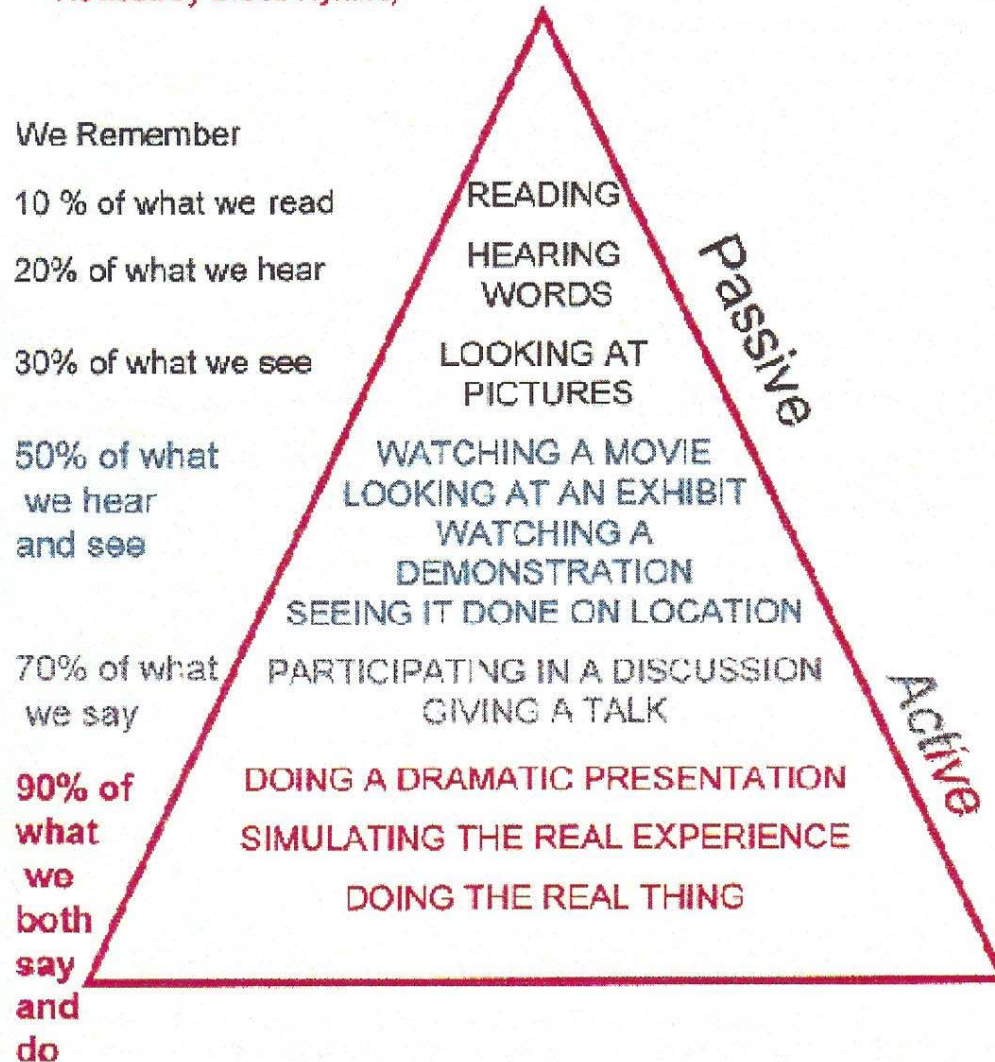

- Experiments can be run by students without extensive preparation or supervision (faculty or TA).
- Typical time to complete step testing and PI controller design is 1 to 2 hours per group (can be treated like a homework assignment)
- Most groups run the experiment from the department computer labs
- Experiments are also suitable for lecture demos.
- National Instruments software provides a good interface.

Multimedia and Computer-Based Learning

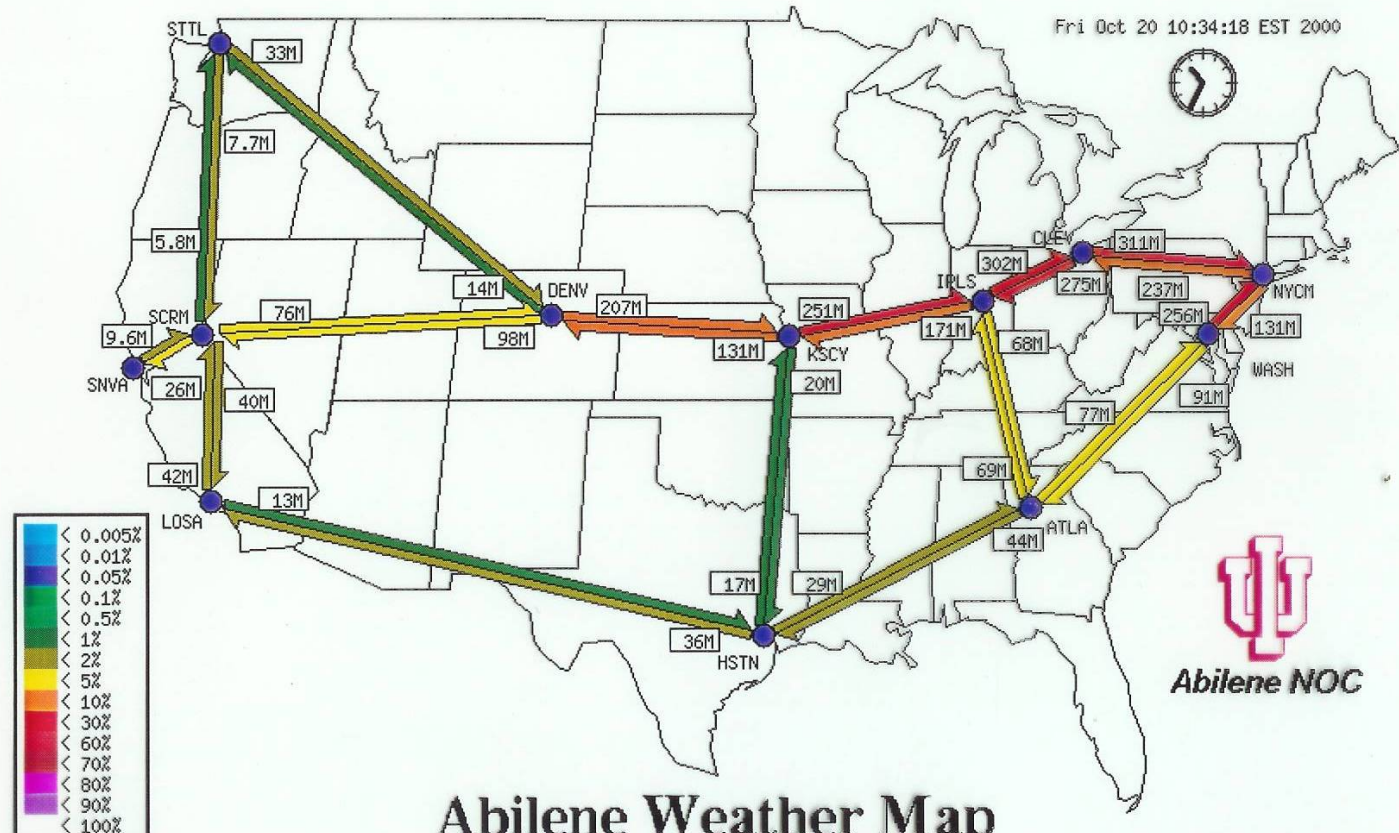

- Self-paced methods (checkpoints on learning or mastery of concepts)
- Interactive learning
- Increased use of audio/video, animation, simulation
- Making class materials readily available (web)
- Requires high bandwidth for effective use

Active Learning

(based on Edgar Dale's Cone of Experience
Revised by Bruce Hyland)

Fri Oct 20 10:34:18 EST 2000

Abilene Weather Map

Line Utilization

Internet2 Applications

- Interactive collaboration and instruction
- Real-time, sensor-based modeling and simulation
- Multi-site computation and database processing
- Shared virtual reality – “tele-immersion”

Distance Learning – Delivery Technologies

- Internet – “web-based courses”
- Interactive video
- CD ROMs
- Broadcast and cable video
- Satellite
- Audioconferencing
- Print/media based

Drivers for Web-based Learning

- Constituency driven
 - Workforce development
- Industry practices in CBT
(e.g., 90% of all training at Dell)
- Increased interaction outside of class via asynchronous learning
- Not necessarily lower cost but private DE providers are profitable

Internet-Based Delivery

- Technology used to enhance learning experience
- Technology used to deliver course
- Telepresence achieved via high bandwidth (> 1 MB/s)
- Students can be in class or at a distance (or both)

Course Management Tool Features (Blackboard, WebCT)

- Conferencing, on-line chat, and email (privacy question)
- Student progress tracking and self-evaluation
- Student/group project organization, work areas, homepages
- Grade maintenance/distribution
- Access control
- Auto-marked quizzes
- Automatic index generation
- Course calendar
- Course content searches

Grid Computing

- Alternative to PC clusters (or Big Iron)
- Building momentum on many campuses and in industry
- Utilizes slack processing resources in individual PCs
- Modeled after SETI@home (5M desktops)
- Attractive for big computational projects (weather prediction, oil reservoirs, gene research)

New Technology Will Change Research and Instruction and Also Cyberinfrastructure

- Groupware
- Virtual experiments
- Desktop computing (Moore's law)
- Mobile computing
- Query of image content
- Use of intelligent agents
- Speech synthesis and text to speech conversion
